TRIODE—OUTPUT BEAM TETRODE
Indirectly heated—for series operation

TENTATIVE

GENERAL

This valve is a dual type, consisting of a Triode and an Output Beam Tetrode in the same envelope, each section having its own cathode. It is suitable for use in the Audio Amplifier or Frame Time-Base stages of television receivers designed for AC/DC mains operation and having series connected heater chains.

RATING

		Tetrode	Triode
Heater Current (amps)	I_h		0.3

Amplification Factor	μ		18*
Anode Impedance (ohms)	r_a		5,300*
Maximum Heater to Cathode Voltage (volts) (r.m.s.)	$V_{h-k}(\text{max})$	150‡	

* Measured at $V_a = 200\text{v}$. $I_a = 10\text{mA}$.

§ Measured with $V_a = 170\text{v}$. $V_{g_2} = 180\text{v}$. $I_a = 32\text{mA}$.

† The total anode dissipation of both sections not to exceed 6 watts.

‡ Measured with respect to the higher potential heater pin.

The characteristics for the triode section of the 30PLI are the same as for the 6/30L2 triode.

The frame output stage should be designed to allow for valve spread and deterioration during life in addition to component variation. Values of total tetrode peak anode current available for a new average valve and at the assumed end of life point on any valve are as follows :

	V_a (volts)	V_{g2} (volts)	V_{g1} (volts)	I_a (mA)
Average New Valve	50	170	-1	88
Assumed End of Life Condition	50	170	-1	57
