BEAM POWER TUBE

RCA-7650 is a small, forced-air cooled uhf beam power tube designed for applications where dependable performance under severe shock and vibration is essential. It is intended for use in compact aircraft, mobile and stationary equipment. It is rated as an af power amplifier and modulator and to frequencies up to 1215 Mc as a linear rf power amplifier in single-side-band suppressed-carrier service, as a plate-modulated rf power amplifier in Class C telephony service, as an rf power amplifier and oscillator in Class C telegraphy service, and as an rf power amplifier in Class C FM telephony service.

The 7650 and variants of its basic design may also be useful in applications such as frequency multipliers, linear rf power amplifiers (AM or television), pulse modulators, pulsed-rf amplifiers, regulators, or other special services. Variations in cooling structure or other parameters are also possible. For information on variants, contact your RCA field representative, the nearest District Sales Office, or Manager, Power Tube Marketing, RCA, Lancaster, Pa.

The 7650 features the Cermolox construction, a unipotential cathode of the oxide-coated matrix type, and an integral louvered-fin radiator. In addition, it contains an axial ceramic pin which rigidly holds grid No.1, grid No.2, and cathode in fixed positions with respect to each other. Details of these features are described in the Application Guide for RCA Power Tubes, ICE-300*.

FOOTNOTES

- ^a Measured with special shield adapter.
^b See Section V.C. of 1CE-300.
^c The maximum rating for a signal having a minimum peak-to-average power ratio less than 2, such as is obtained in "Single-Tone" operation, is 500 ma.

During short periods of circuit adjustment under "Single-Tone" conditions, the average plate current may be as high as 700 ma.

- ^d See Section V.B.2 of 1CE-300.
^e See Section V.B.1 of 1CE-300.

5. Interelectrode Leakage Resistance.	5	8.0	-	megohms
6. Cutoff Grid-No.1 Voltage	1,6	-	-87	volts

Note 1: With 6.3 volts, ac or dc on heater.

Note 2: Measured with special shield adapter.

Note 3: With dc plate voltage of 2500 volts, dc grid-No.2 voltage of 400 volts, and dc grid-No.1 voltage adjusted to give a plate current of 240 ma.

Note 4: For conditions with grid No.1, grid No.2, and plate tied together; and pulse voltage source of 850 peak volts between plate and cathode. Pulse duration is 2 microseconds, pulse repetition frequency is 60 pps, and duty factor is 0.00012. Peak emission current is read after 1 minute.

Note 5: Under conditions with tube at 20° to 30° C for at least 30 minutes without any voltages applied to the tube. The minimum resistance between any two electrodes (except across heater terminals) is measured with a 200-volt Megger-type ohmmeter having an internal impedance of 1.0 megohm.

Note 6: With dc plate voltage of 2500 volts, dc grid-No.2 voltage of 400 volts, and dc grid-No.1 voltage adjusted to give a plate current of 5 ma.

SPECIAL TESTS AND PERFORMANCE DATA

The environmental conditions shown for the tests below are those applied directly to the tube. Extreme care must be used in the design of the mountings to minimize mounting resonances.

50g, 11-Millisecond Shock Test:

This test is performed on samples of tubes to determine the ability of the tube to withstand the specified long-duration impact acceleration. Tubes are held rigid in six different positions in a medium impact shock machine and are subjected to three blows in each position.

At the end of this test, tubes will not show permanent or temporary shorts or open circuits.

500g, Nominal 3/4-Millisecond Shock Test:

This test is performed on samples of tubes to determine the ability of the tube to withstand the specified impact acceleration. Tubes are held rigid in four different positions in a high-impact shock machine and are subjected to five blows in each position.

At the end of this test, tubes will not show permanent or temporary shorts or open circuits.

5-2000 cps Variable Frequency Vibration Test:

This test is performed on samples of tubes to determine the ability of the tube to withstand variable frequency vibration. With heater voltage of 6.3 volts ac or dc, dc plate supply voltage of 300 volts, dc grid-No.2 voltage of 250 volts, grid-No.1 voltage adjusted to give dc plate current of 10 ma, and plate load resistor of 2000 ohms. This tube is vibrated along each of three mutually perpendicular axes over an 8-minute sweep consisting of:

- 5-10 cps with fixed double amplitude of 0.080 inch \pm 10%.
- 10-15 cps at fixed acceleration of 0.41g \pm 10%.
- 15-105 cps with fixed double amplitude of 0.036 inch \pm 10%.
- 105-2000 cps at fixed acceleration of 20g \pm 10%.

At the end of this test, tubes will not show permanent or temporary shorts or open circuits.

**TERMINAL DIAGRAM**

NOTE 1: THE FOLLOWING DIAMETRICAL SPACE REQUIREMENTS ACCOMMODATE THE CONCENTRICITY OF THE CYLINDRICAL SURFACES OF THE RADIATOR BAND AND EACH ELECTRODE TERMINAL:

- Radiator Band - 2.112"
- Plate Terminal - 1.801"
- Grid-No.2 Terminal - 1.611"
- Grid-No.1 Terminal - 1.321"
- Heater-Cathode Terminal - 1.021"
- Heater Terminal - 0.621"

NOTE 2: THE DIAMETER OF EACH TERMINAL IS HELD TO INDICATED VALUES ONLY OVER THE INDICATED MINIMUM LENGTH OF ITS CONTACT SURFACE.

NOTE 3: KEEP ALL STIPPLED REGIONS CLEAR. DO NOT ALLOW CONTACTS OR CIRCUIT COMPONENTS TO PROTRUDE INTO THESE ANNULAR VOLUMES. DIAMETERS OF STIPPLED AREAS ABOVE AIR-COOLED RADIATOR, PLATE TERMINAL CONTACT SURFACE, AND GRID-NO.2 TERMINAL CONTACT SURFACE SHALL NOT BE GREATER THAN ITS ASSOCIATED DIAMETER.

FORCED-AIR COOLING

Air Flow:

Through radiator — Adequate air flow to limit the plate core temperature to 250° C should be delivered by a blower, such as Rotron* AS-301, AXIMAX 1, or equivalent, through the radiator before and during the application of heater, plate, grid-No.2, and grid-No.1 voltages.

Typical values of air flow directed through the radiator to maintain the plate core (See *Dimensional Outline*) at 250° C with an incoming air temperature of 25° C and with no restrictions at the plate contact flange are:

Plate Dissipation (watts)	Air Flow (cubic ft/min)	Static Pressure (inches of water)
100	2	0.04
300	4	0.14
600	11	0.66
700	16	0.96

To Plate, Grid-No.2, Grid-No.1, Heater-Cathode, and Heater Terminals — A sufficient quantity of air should be allowed to flow past each of these terminals so that their temperature does not exceed the specified maximum value of 250° C. An air flow of 2.5 cfm is usually adequate.

During Standby Operation — Cooling air is required to the Heater-Cathode and Heater Terminals when only heater voltage is applied to the tube.

During Shutdown Operation — Air flow should continue for a few minutes after all electrode power is removed.

Mounting

See the preferred mounting arrangement below. See section III.C.3.a of ICE-300 for a description of the fixed method of mounting. The adjustable method is not recommended for the 7650.
