NOTES

1. The tube must be operated at the stated filament voltage. Fluctuation in filament voltage must not exceed +5% or -10%. The centre-tap pin may be used for the anode current return but must not be used for the filament current supply. At frequencies above 30 MHz, all three filament pins should be interconnected with suitable capacitors.

2. The feedback ratio is defined as $\frac{V_g \text{ (pk)}}{V_a \text{ (pk)}}$

where $V_g \text{ (pk)}$ = peak r.f. grid voltage in volts
and $V_a \text{ (pk)}$ = peak r.f. anode voltage in volts.

3. Effective output power to load = $\eta_a (P_{\text{out}} - P_{\text{drive}})$

where η_a = efficiency of anode circuit = 85% (typical value)

P_{out} = output power of valve to anode circuit

P_{drive} = drive power fed back to grid circuit.
